

# TOPIC 11 ASSESSMENT REPORT

Security, Rate Limits & Production Scaling — Retell AI

**Prepared by:** Shaik Mohammad Shaheed    **Agent:** Trainee\_Sarah\_Receptionist

**Evidence update:** 6 October 2026

## 1. Objective

This report documents Retell AI security/scaling settings reviewed and the observed results from one Playground PII-redaction call. Configurations and single-call observations are distinguished from unperformed production tests.

## 2. Configuration Reviewed

| Area              | Observed configuration / status                                           |
|-------------------|---------------------------------------------------------------------------|
| Data storage      | "Everything except PII" selected; 30-day retention.                       |
| PII redaction     | 14 sensitive-data categories configured.                                  |
| Keypad / DTMF     | User Keypad Input Detection enabled; timeout 2.5 seconds; digit limit 4.  |
| API keys          | Existing Secret Key value masked; rotation/revocation not performed.      |
| Concurrency / CPS | Concurrent Calls Limit 20; dashboard telephony CPS limits displayed as 1. |
| Webhook           | Webhook endpoint configured; no webhook test sent.                        |
| Reliability       | Optional Stable Server paid feature left disabled.                        |

## 3. Playground PII Test — Observed Result

One Playground web call was completed on 6 October 2026 using synthetic personal/payment details. Call History displayed 0:29 duration (audio player: 0:28) and a cost of \$0.090. The transcript displayed placeholders such as [person name 1] and [credit card 1] instead of the entered name and card digits. The agent warned the caller not to share card details.

**Transcript outcome:** PII placeholders were visible in this call. **Audio outcome:** The user played the downloaded recording and reported hearing silence during the credit-card disclosure segment. This supports an observed audio-redaction result for this one call, not a comprehensive test of all PII categories.

## 4. Evidence

Evidence includes the Call History transcript/details screenshot, the Detail Logs screenshot, the existing configuration screenshots, and the downloaded call recording. Before keeping the recording in a public repository, check that no sensitive details remain audible in any segment; remove or replace it with a safely redacted clip if uncertain.

## 5. Tests Not Performed

No API-key rotation/revocation test, 110-request rate-limit test, 21-call concurrency test, webhook delivery/signature test, retention deletion test, or encryption audit was performed. HTTP 429 behavior, secure DTMF capture, and production/load behavior therefore remain unverified.

## 6. Recording and Repository

GitHub: [Open repository](#)

## 7. Final Status

The evidence supports transcript placeholders and a user-reported silent segment during the sensitive utterance in one test call. This does not certify production security or validate the other tests listed above.

*Prepared for LMS submission. Based on configuration and evidence available on 6 October 2026.*
